Variable	Value
DESCRIPTION	Analysis dataset useful for analyses of Neurocognitive and MRI data as well as Neurocog / MRI comparisons
KEYFIELDS	
STRUCTURE	One observation per subject per visit
INPUT_NOTES	Use the NP_MRIanly program to create NP_NEWMRIANLY. JAMA_ID dataset will come from: S:\RhoFED\CSCC\Protocol Committees\Neuropsych\Analysis\FinalAnly\JAMA_val2011 Imaging datasets ClincalReads and Volume will be Access databases, not SAS datasets. Imaging datasets will come from: S:\RhoFED\CSCC\Protocol Committees\Neuropsych\data\Imaging\Phase II If SCANCODE ends in 1P and SUBJECTID is a duplicate, keep the observations with the later ACQUISITION_DATE. FOR CLINICALREADS DATASET, ID = SUBJECTID FOR THE VOLUME DATASET, ID = substr(SUBJECTCODE,3,7)
OUTPUT_NOTES	

NOTES:
- All dates were converted to the number of days from the subject's date of informed consent for the phase II pilot transfusion study (variable P1INFCDT, see description in table below).
- All created study day variable names end with "DY".
- PT_ID is in included in the data instead of ID which is a randomly generated fake ID
- For deidentification purposes, some variables have been removed from the final analysis datasets. These are the variables you'll see crossed out in redacted 'black' in the specifications below to avoid confusion. Some of these also included phase II variables.
- IDs and DATES used as hardcodes in the variable definition fields have also been redacted for the same reasons.
- Red text items: ignore these as they were for internal use and represent the more recent updates.
